

## Hose Burst Valve direct-acting flat seat valve, Cartridge – 350 bar RBE 1/4 to 3/4

### FUNCTION

The hose burst valve is a flow operated flat seat valve which prevents uncontrolled movement in the consumer in the event of a hose burst.

The hose burst valve is open in the normal position and allows flow in both directions. If the pre-set actuating flow rate is exceeded as a result of a hose burst, for example, the valve quickly closes and blocks the flow from port 1 to port 2.

#### Caution:

The actuating flow rate should be at least 20% higher than the highest flow rate in the system, to prevent the valve reacting too sensitively. Due to the effects of acceleration and inertia, the valve should be replaced after a hose burst.

### FEATURES

- Hose burst valves for direct installation in cylinders, lines and control manifolds
- Highly reliable thanks to fast response
- Unauthorized adjustment not possible once installed
- Choice of four sizes for optimum adaptability to the system
- Different flow rate settings available as an option

### Note

The valves are set to the max. actuating flow rate as standard and can be adjusted by the user. Equally, valves with fixed settings are also available. The valve is set according to the setting curves by varying the gap "h" (see diagrams).

To change the setting, loosen the lock nut, measure the gap using setting gauges, or similar, and then re-tighten lock nut.
